New Biol. 3:769-778(1991).

-!- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO EPHRIN-A2, -A3, -A4 AND -A5.

-!- CAPALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE BY ADERBY E - II-SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- ALTERNATIVE PRODUCTS: A SECRETED VARIANT WITHOUT THE TRANSMEMBRANE REGION AND THE KINASE DOMAIN IS PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE.

RT "Identification of a new eph-related receptor tyrosine kinase gene

RT from mouse and chicken that is developmentally regulated and encodes

RT at least two forms of the receptor.";

RL New Biol. 3:769-778(1991).

CC -1- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO

CC EPHRIN-A2, -A3, -A4 AND -A5.

CC -1- FUNCTION: ACTIVITY ATP + A PROTEIN TYROSINE - ADP +

CC PROTEIN TYROSINE PHOSPHATE.

CC -1- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

CC -1- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

CC -1- TISSUE SPECIFICITY: GREATEST LEVELS OF EXPRESSION OCCURRING IN TH

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATI-
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MGI:10803

MDK1.

MDK1.

IN SMERTYO. IN ADULT,
EXPRESSION RESTRICTED TO HIPPOCAMPUS, TESTIS AND SPLEEN.
EXPRESSION RESTRICTED TO HIPPOCAMPUS, TESTIS AND SPLEEN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATA.
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BI EPHRIN-A1, -A2, -A3, -A4 AND -A5.

CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE BHOSPHATE.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (MDK1, MT ALTERNATIVE PRODUCTS: FIVE FORMS OF THE PROTEIN (MDK1, MT MDK1-2, MDK1-1, AND MDK1-T2) ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE. THE SEQUENCE SHOWN HERE IS THAT SPLICING OF THE SAME GENE. THE SEQUENCE SHOWN HERE IS THAT SPLICING OF THE SAME GENE.

ALTERNATIVE PRODUCTS: TWO FORMS ARE PRODUCED BY ALTERNATIVE
SPLICING, THE TRUNCATED FORM LACKS THE KINASE DOMAIN. THE LONG
FORM IS MORE WIDELY EXPRESSED IN THE EMBRYO.
TISSUE SPECIFICITY: RESTRICTED TO THE NERVOUS SYSTEM.
SIMILARITY: TO OTHER PROTEIN-TYPOSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EPHRIN-A1, -A2, -A3, -A4 AND -A5.
CATALYTIC ACTIVITY: ATP + A PROTEIN
PROTEIN TYROSINE PHOSPHATE.

Claim 6; Fig 1; 58pp; English.

This sequence represets human eph/elk-like kinase (HEK). HEK is expressed in both pre-B cells and T cell lines and in a number of tumours of human origin, eg. lymphoid tumours LKG3, Lila-1 and JM, and the epithelial tumour HeLa. This receptor-type thymidine kinase (TK) and/or its ligands are useful as agents in modulation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer; expression vector; extracellular domain; human; HEK; eph/elk-like; kinase; pre-B; cell; T; tumour; lymphoid; LK63; Lila-1; JM; epithelial; HeLa; receptor-type; thymidine kinase; TK; ligand; B;cellular response; growth; differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HEK polypeptide.

Probes derived from the EPH-related PTMs Cek4 (090659) and Ce (090660) were used to isolate novel cDNA clones (090652-58, 090661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina. Seguence 983 AA;

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding prof Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-2. Sequence 948 AA;

DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKs, bpTK1, bpTK2, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for bpTK7 (R85956) was also obtd. bpTK7 can be used to design drugs that modulate pTK activity.
4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK6 HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (702946-49) from a human foetal by cDNA library. HEK7 and HEK8 (T02946-49) from boology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK8 receptors (or their soluble extracellular domains) are produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               EPH-like receptor protein tyrosine kinase HEK8.
EPH-like receptor protein tyrosine kinase; PTK; HEK8;
human eph-like kinase; therapy; diagnosis; vector; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Wood

                        Claim 1; Fig 2; 72pp; English.

Claim 1; Fig 2; 72pp; English.

The present sequence represents mouse Bsk, which is a receptor-like tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations in the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can also be delivered into the limbic system of patients with limbic system neurodegenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative disease, viral infections, bacterial infections, brain injuries, neoplastic conditions, Alzheimer's disease, epilepsy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression cells, and

Example: Fig 22: 194pp: English.

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding proteins: Ror-1: Ror-2: Ehk-1: and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-1.

AL-1 neurotrophic factor, an eph-tyrosine kinase ligand - used in treatment and diagnosis of neuronal disorders and angiogenesis-related conditions.

The angiogenesis-related conditions.

Example 1; Page 50-53; 75pp; English.

Example 1; Page 50-53; 75pp; English.

Rat REK7 (R97853) is an eph-related tyrosine kinase receptor, for which AL-1 (see also W97854) is a ligand. Its amino acid sequence which AL-1 (see also W97854) is a ligand. Its amino acid sequence was deduced from a cDNA clone (T18893) isolated from a hippocampal cDNA library. An REK-19G fusion was used to screen cultured cell lines for surface expression of REK7-binding activity. Primers (see also T44382-83) based on peptide sequences (R97885-59) of isolated ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human footal brain cDNA library, leading to the isolation of AL-1 cDNA crimages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 72.1
